Autophagy: Chapter 19. Autophagy as a Sensitization Target in Cancer Therapy Xi Chen, Xiao-Ming Yin

Autophagy is involved in the resistance against anticancer treatment. Both autophagy inhibitors and inducers have been demonstrated to be effective in enhancing the effect of chemotherapy and irradiation in various anticancer regimes. Currently, autophagy inhibitors are being examined in clinical trials as an adjuvant for traditional therapies. However, caution must be exercised, considering the complexity of autophagy regulation in tumorigenesis and in development of therapeutic resistance. There is also evidence suggesting that targeting autophagy may not have the desired effects. We have found that cancer cells with long-term autophagy deficiency can evade the dependence on autophagy to survive. Furthermore, some tumors are intrinsically insensitive to autophagy manipulation. Although regulation of autophagy is a promising new addition to cancer therapy, careful evaluations must be exercised when applying this strategy in clinical practice on individual bases.
