Clinical Neurotherapy: Chapter One. Definitions, Standard of Care and Ethical Considerations

D.Corydon Hammond

Nonpharmacological methods of therapeutically influencing the brain have become widely used by clinical practitioners, and there is an accumulating body of outcome research. This chapter introduces readers to existing neurofeedback (EEG biofeedback) methodologies, as well as different modalities of neurotherapy for brain stimulation. Neurofeedback methods include symptom-based neurofeedback, neurofeedback guided by quantitative electroencephalography data, neurofeedback based on normative database Z-score and LORETA data, the Low Energy Neurofeedback System, slow cortical potentials training, fMRI neurofeedback, hemoencephalography training and infra-low frequency training. Brain stimulation technologies include electroconvulsive therapy, transcranial magnetic stimulation, deep brain stimulation, vagal nerve stimulation, cranial electrotherapy stimulation, transcranial direct current stimulation, a pulsed electromagnetic stimulation device, and audiovisual stimulation. Ethical and standard of care issues and considerations for liability protection are then reviewed.
