With the exponential growth of the number of Internet nodes, the volume of the data transported on the backbone has increased with the same trend. The load of the global Internet backbone will soon increase to tens of terabits per second. This indicates that the backbone bandwidth requirements will increase by a factor of 50 to 100 every seven years. Transportation of such high volumes of data requires suitable media with low loss and high bandwidth. Among the available transmission media, optical fibers achieve the best performance in terms of loss and bandwidth. High-speed data can be transported over hundreds of kilometers of single-mode fiber without significant loss in signal integrity. These fibers progressively benefit from reduction of cost and improvement of performance. Meanwhile, the electronic interfaces used in an optical network are not capable of exploiting the ultimate bandwidth of the fiber, limiting the throughput of the network. Different solutions at both the system and the circuit levels have been proposed to increase the data rate of the backbone. System-level solutions are based on the utilization of wave-division multiplexing (WDM), using different colors of light to transmit several sequences simultaneously. In parallel with that, a great deal of effort has been put into increasing the operating rate of the electronic transceivers using highly-developed fabrication processes and novel circuit techniques.

From reader reviews:

Christopher Olsen:

What do you regarding book? It is not important with you? Or just adding material if you want something to explain what your own problem? How about your spare time? Or are you busy individual? If you don't have spare time to accomplish others business, it is make one feel bored faster. And you have free time? What did you do? Everybody has many questions above. They should answer that question due to the fact just their can do this. It said that about book. Book is familiar on every person. Yes, it is correct. Because start from on kindergarten until university need this particular High-Speed CMOS Circuits for Optical Receivers to read.

Harold Graham:

The book with title High-Speed CMOS Circuits for Optical Receivers possesses a lot of information that you can learn it. You can get a lot of advantage after read this book. That book exist new knowledge the information that exist in this book represented the condition of the world right now. That is important to yo7u to learn how the improvement of the world. This book will bring you throughout new era of the globalization. You can read the e-book on your own smart phone, so you can read the item anywhere you want.

Nancy Lord:

Are you kind of hectic person, only have 10 as well as 15 minute in your day time to upgrading your mind talent or thinking skill perhaps analytical thinking? Then you are experiencing problem with the book compared to can satisfy your small amount of time to read it because pretty much everything time you only find guide that need more time to be examine. High-Speed CMOS Circuits for Optical Receivers can be your answer mainly because it can be read by anyone who have those short extra time problems.

Elaine Woodring:

Beside this specific High-Speed CMOS Circuits for Optical Receivers in your phone, it may give you a way to get more close to the new knowledge or facts. The information and the knowledge you are going to got here is fresh in the oven so don't possibly be worry if you feel like an previous people live in narrow small town. It is good thing to have High-Speed CMOS Circuits for Optical Receivers because this book offers to your account readable information. Do you at times have book but you seldom get what it's facts concerning. Oh come on, that won't happen if you have this inside your hand. The Enjoyable set up here cannot be questionable, including treasuring beautiful island. So do you still want to miss that? Find this book and read it from currently!
